

How It Works

A product walkthrough — job-seeker & employer sides

Job Assistant is a two-sided talent marketplace for Zimbabwe & Southern Africa. It helps **job seekers** find and apply to jobs with AI-tailored applications, and helps **employers** discover, vet, and message candidates.

HOW IT WORKS · JOB SEEKER (RECRUITEE)

From a blank page to a sent application

1

Land & search

The landing page lets a visitor choose their intent — “I’m looking for work” or “I’m hiring” — and search by title/skill and city.

2

Get a CV — upload or build

Upload an existing CV (PDF/DOCX/image, converted to clean text) or build one from scratch with the guided CV Builder — the answer for first-time seekers with no CV. Multiple CVs: rename, edit in a Word-like editor, set a primary.

3

Browse jobs

Jobs are aggregated from Zimbabwean boards, de-duplicated and enriched (logo, sector, salary, deadline, apply email). Each card has two actions: Apply (free) and AI Apply (3 credits) which tailors the CV + cover note to that job.

4

Swipe 2 Match & Nearby

A Tinder-style deck to swipe right/left on jobs; liked jobs form a shortlist. A radar view surfaces jobs by city with optional geolocation.

5

Apply from your own Gmail

Applications send from the candidate's own Gmail (OAuth), so they land from the real person. Choose “My original CV” (the uploaded file, with a picker across several CVs) or an AI-tailored version exported to PDF/Word. A success chime confirms the send; applications are tracked.

6

Profile, verification & credits

Publish a profile to be discoverable, order background checks (identity/education/employment/criminal) that show as verified badges, and top up credits (new accounts start with 50 free).

HOW IT WORKS · EMPLOYER (RECRUITER)

Register → discover → unlock → hire

1**Register & get approved**

Employers register a company with a verification document and are approved by an admin before unlocking contacts — this protects the candidate pool.

2**Browse candidates by sector**

Approved employers browse candidate cards grouped by sector, with headline, experience, skills and verified badges.

3**Swipe to shortlist**

A recruiter swipe deck shortlists the right candidates quickly; picks are saved for follow-up.

4**Unlock & message**

Revealing a candidate's contact details spends credits — a core revenue event — then the employer messages the candidate in-app, two-way.

5**Admin & announcements**

Admins approve/reject employers, manage admins, review background-check orders, and post product announcements that surface in everyone's notification bell.

UNDER THE HOOD

One-paragraph architecture

A **Next.js** frontend (Vercel) talks to a **Cloudflare Worker** API backed by a KV store. AI runs on **Cloudflare Workers AI** (Llama 3.3) with an OpenAI fallback, behind a provider-agnostic layer. Auth is Google (NextAuth); the Gmail access token stays server-side so applications send from the user's own mailbox. Payments are Stripe Checkout (credit packs), with mobile money (Paynow/EcoCash) planned.

*Companion document: the business case, pricing, unit economics and projections are in the pitch deck (**Job-Assistant-Pitch.pptx**). Screenshots of each page can be added under docs/screenshots/.*
